Preface	1
1 Introduction	1
1.1 Goals of the course	1
1.2 Suggestions to students	1
1.3 Structure of the text	2
1.4 Notation and conventions	3
1.5 Topics covered in the course	5
1.6 Principles of program design	6
I The MATLAB programming environment	7
2 The Command Window	9
2.1 Configuration Preferences	9
2.2 Command-line session in the Command Window	10
2.3 Computing $\sqrt{5}$ using Newton's algorithm	11
2.4 Manually iterating Newton algorithm	12
2.5 What the current implementation accomplishes	15
2.6 Shortcomings of the current implementation	15
2.7 Topics covered in this chapter	15
3 The Edit Window	17
3.1 Creating an M-file in the Edit Window (NewtonAlg2.m)	17
3.2 Introduction to the Debugger	21
3.3 An improved version (NewtonAlg3.m)	24
3.4 What the current implementation accomplishes	28
3.5 Shortcomings of the current implementation	29
3.6 Topics covered in this chapter	29
4 The Help Browser and Command/Edit Windows revisited	31
4.1 Navigating the MATLAB documentation	31
4.2 Script Files: The Command Window is dead; Long live the Edit Window	33

4.3	Debugging: The Command Window still lives	36
4.4	Topics covered in this chapter	37
II Writing a simple MATLAB program		39
5	Displaying Output	41
5.1	Formatting numeric output (NewtonAlg4.m)	41
5.2	Elimination of the hardwired values (NewtonAlg5.m)	47
5.3	Formatting table output (NewtonAlg6.m)	48
5.4	What the current implementation accomplishes	49
5.5	Shortcomings of the current implementation	49
5.6	Topics covered in this chapter	49
6	Conditionals and Flow control	51
6.1	Logical (Boolean) expressions	52
6.2	Conditional statements	53
6.3	The full-blown if-elseif-else-end statement	58
6.4	More control: for-loops and while-loops	60
6.5	Topics covered in this chapter	63
7	Arrays I	65
7.1	Using arrays for storage (NewtonAlg7.m)	65
7.2	What the current implementation accomplishes	71
7.3	Shortcomings of the current implementation	71
7.4	Topics covered in this chapter	71
8	Arrays II	73
8.1	Array initialization	73
8.2	Array operations	76
8.3	Performance: for-loop vs. array-operation vs. built-in implementations	78
8.4	Topics covered in this chapter	85
9	Arrays III	87
9.1	Accessing array elements	87
9.2	Using arrays to represent mathematical functions	89
9.3	Topics covered in this chapter	93
10	Plotting I	95
10.1	Plotting a collection of data points in the plane	95
10.2	Controlling the appearance of plots	99
10.3	Plotting parametric curves in the plane	105
10.4	Topics covered in this chapter	108

11 Computing $\sqrt{5}$: NewtonAlg.m	109
11.1 The order of convergence of iterative numerical algorithms	109
11.2 Applying plotting techniques to numerical investigations	111
11.3 Topics covered in this chapter	114
III Writing a complex MATLAB program	115
12 Functions I	117
12.1 A simple example of a user-defined function	118
12.2 Passing arguments and returning values	120
12.3 Implementing NewtonAlg as a function (NewtonAlg10.m)	126
12.4 Topics covered in this chapter	128
13 Functions II	129
13.1 Tolerance as a terminating condition (NewtonAlg12.m)	129
13.2 A complex program (Main.m, Tabulate.m, NewtonAlg13.m)	134
13.3 Topics covered in this chapter	141
14 Functions III	143
14.1 Calling functions indirectly using function handles	145
14.2 Adapting NewtonAlg to any equation (ScalarNewton.m)	147
14.3 Subfunctions (RootFinder.m)	149
14.4 Topics covered in this chapter	153
15 Arrays IV	155
15.1 Multi-dimensional arrays and Matrix Algebra	155
15.2 Topics covered in this chapter	166
16 Arrays V	167
16.1 The empty array and dynamic allocation	167
16.2 Cell arrays	170
16.3 Topics covered in this chapter	173
17 Sharing Data I	175
17.1 Global variables and callbacks (OdeMain.m)	175
17.2 GUI programming (OdeGui.m)	178
17.3 Structures	184
17.4 Topics covered in this chapter	188
18 Sharing Data II	189
18.1 MAT-files (CompareAXeqB.m)	189
18.2 Lookup tables (Pascal.m)	195
18.3 Topics covered in this chapter	199

19 Plotting II	201
19.1 Plotting parameterized curves in three dimensions	201
19.2 Rotations and Projections (HelixMain.m)	203
19.3 Object-oriented programming (SliderGui.m)	206
19.4 Topics covered in this chapter	211
20 Plotting III	213
20.1 Graphing the function $z = F(x, y)$ (GraphZ.m)	214
20.2 Plotting surfaces in three dimensions (Paraboloid.m)	217
20.3 Plotting trajectories of a constrained dynamical system (Gravity.m)	227
20.4 Topics covered in this chapter	234
21 Systems of nonlinear equations	235
21.1 Generalizing scalar equations	235
21.2 Vectorizing the Newton algorithm for systems (VectorNewton.m)	237
21.3 A root-finder for two dimensional systems (Nonlinear2dSolver.m)	240
21.4 Topics covered in this chapter	245
